

## FIGURE 4 — REPORTED VS. HONEST COVERAGE (CS#2)

*Podcast-Pipeline, 2026-03-07. Removing the `pyproject.toml` omit list dropped measured coverage from 77% to 15%.*

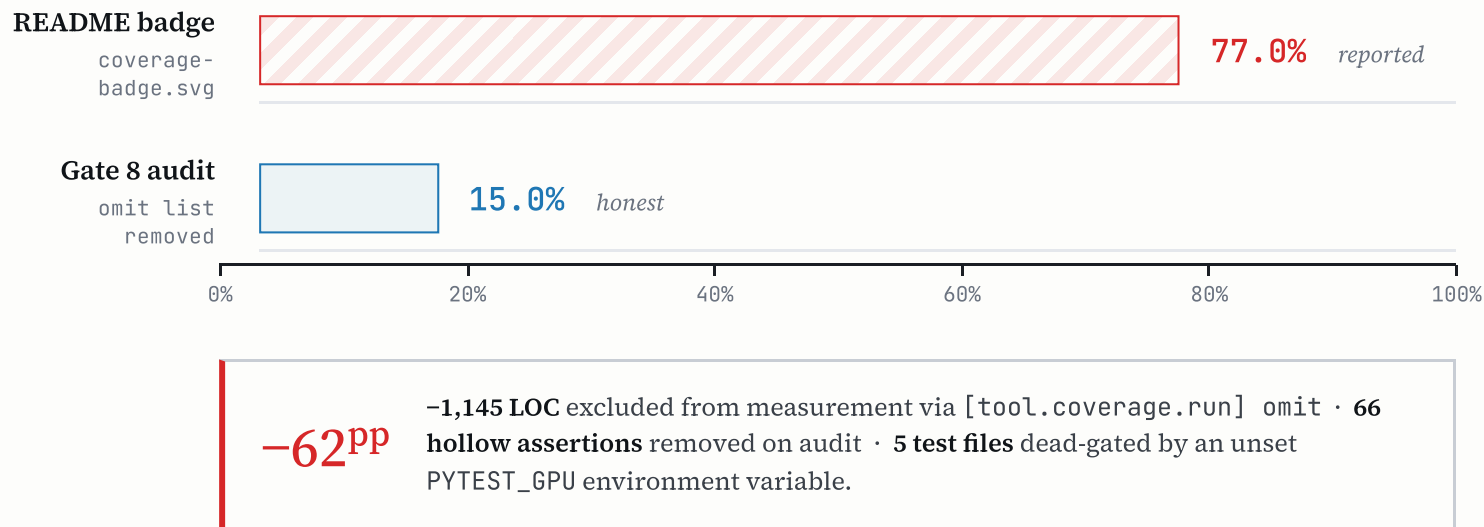

FIGURE 4. Reported vs. honest coverage for Case Study #2. The 77% figure was the value displayed by the repository’s README badge; the 15% figure is the output of `coverage run` after the `[tool.coverage.run] omit` list was removed. The 62-percentage-point gap corresponds to 1,145 LOC of business logic excluded from measurement, 66 hollow assertions removed on audit, and 5 test files dead-gated by an unset `PYTEST_GPU` environment variable. Full file-level breakdown appears in §5.2 of the paper.
